Rules-based sleeves a pleb can run

15 Sep 2026

Rules-based sleeves a pleb can run. No timing. No options. Dividend cash goes back into the stack on the day it hits.

This is not financial advice.

Most people do not need another analyst. They need a book they can explain in one breath, rebalance monthly, and leave alone for five years.

Paperstreet is four of those books. Same principles on every sleeve: simplicity, scale for a normal account, a five-year clock, Buffett/Munger temperament, and DCA so nobody has to pretend they can time Bitcoin.

The hurdle is spot BTC. Retail already has the easy benchmarks — BRK.B, SPY, QQQ, GLD, raw BTC, raw MSTR. Buy and hold. No rebalance. If a sleeve cannot live next to those, it does not belong in the book.

The two stacking sleeves

Berkshire Killer is the balanced growth book.

40% BTC / 20% STRC / 30% TSLA / 10% PLTR.

Continuous BTC stacking. STRC dividend rebalanced into BTC on the day it is issued. Bitcoin is the core. Tesla and Palantir are the operating-company growth sleeve. STRC is the cash engine that buys more BTC without a timing call.

Hodler Jam Sandwich is the set-and-forget stack.

70% BTC / 10% STRC / 20% MSTR.

Continuous BTC stacking. STRC dividend into BTC on issue day. Ditch the analyst. You do not need a fourth equity. Most of the book is coin. MSTR is the only listed lever. STRC pays the next coin.

The two leverage sleeves

Hedge Fund Killer keeps the same simplicity and turns the lever up.

55% BTC / 35% MSTR / 10% STRC.

Continuous BTC and MSTR stacking. STRC dividend split 50/50 into BTC and MSTR on issue day. No options. Monthly maintenance so the weights do not drift into a dare. Do not get greedy.

Saylor Moon is the passive high-beta degen.

50% MSTR / 50% STRC.

Continuous MSTR stacking. STRC dividend into MSTR on issue day. No coin in the target weights. The whole book is Saylor equity plus the preferred that funds the next share.

The only rules that matter

Weights are the book. They do not get rewritten mid-year because a tape looks ugly.

Dividends move on issue day, not when it feels clever. Berkshire and Hodler Jam Sandwich: STRC → BTC. Hedge Fund Killer: STRC → BTC and MSTR at 50/50. Saylor Moon: STRC → MSTR.

DCA is monthly. That is the strategy. The point of the book is to stop helping people time the market.

Maintenance is monthly on the two leverage sleeves. That is hygiene, not a trade.

The point

These sleeves exist so you can stack Bitcoin passively. Monthly DCA. Dividend cash hits and buys more of the book the same day. No trading calendar. No options. No analyst jargon.

Pick one book. Fund it. Leave it on the five-year clock.
